

Reforged

One-page repo-based product summary

What It Is

Reforged is a gamified iOS Bible reading, study, and Scripture memory app built with SwiftUI. It combines reading, learning tracks, and spaced-repetition practice inside a progression system.

Who It's For

Primary persona: believers who want a structured daily habit for Bible reading, study, and memorization.

What It Does

- Reads 5 Bible translations: ESV, KJV, CSB, NKJV, and NASB.
- Plays ESV audio with playback speed and skip controls.
- Supports search, highlights, notes, and tap-for-Strong's word study.
- Runs Scripture memory in 6 practice modes with SM-2 review scheduling.
- Delivers doctrine and devotional learning tracks with lessons, quizzes, and reflections.
- Adds XP, levels, streaks, streak freezes, badges, and daily insights.
- Syncs profile and progress with CloudKit and surfaces streak status in a widget.

How It Works

- App shell: `ReforgedApp` launches `ContentView`, which shows onboarding first and then the main navigation.
- State and storage: `AppState` is the central `@MainActor` observable object for user profile, tracks, memory verses, and daily insight; it persists data to `UserDefaults`.
- Sync path: when Apple Sign In and CloudKit are available, `AppState` syncs profile, memory verses, highlights, notes, and track progress through `CloudKitSyncService`.
- Bible data path: KJV content is bundled locally; ESV content and audio come from `ESVService`; CSB, NKJV, and NASB come from `ApiBibleService`; both cache chapters on device.
- Study and sharing: word-study uses original-language and Strong's services plus bundled lexicon files; share cards use bundled backgrounds and `UnsplashService`.
- Extension path: `ReforgedWidget` reads shared app-group `UserDefaults` to calculate and display the current reading streak.

How To Run

- Open `Reforged.xcodeproj` in Xcode.
- Select the `Reforged` scheme and an iOS 16.0+ simulator or device.
- Build and run, or use the repo command: ``xcodebuild -project Reforged.xcodeproj -scheme Reforged -destination 'platform=iOS Simulator,name=iPhone 17 Pro' build``.
- Extra local setup steps or secret-management instructions: Not found in repo.
